

Supplementary Material 1

Table A: Effects of the stepwise glucagon intervention in the participants with type 1 diabetes and healthy controls.

Data are presented in the mean value and the standard error of the mean. Participants with type 1 diabetes and healthy controls were compared using a linear mixed effects model with repeated measurements and group-intervention interaction. Data with P-values are presented in the table.

Parameters, mean \pm SEM	Unit	Group	Baseline	Glucagon bolus injection, μg							P	Covariate P ¹

¹Posthoc covariate adjustment of the p-values using the M/I ratio as a measure of insulin sensitivity of each participants.

Supplementary Material 2

Figure: A significant positive correlation between the stepwise glucagon injection and plasma glucagon concentration was observed in T1D ($P < 0.001$). In controls, the trend was similar; however not significant ($P = 0.053$). Between-group analyses showed that while the glucagon levels in T1D were numerically lower than the controls throughout the study, the difference was insignificant ($P = 0.40$). Secondly, the plasma glucagon concentrations in T1D did not change differently to the glucagon injections compared to healthy controls ($P = 0.74$).

Supplementary Material 3

Figure: Plasma glucose levels. Plasma glucose was measured every five minutes during the stepwise glucagon injections.

Supplementary Material 4

Table: Data presents the differences in metabolite changes to glucagon injections in participants with type 1 diabetes compared to healthy controls using untargeted metabolomics profiling. Metabolomics data before and after the completion of the stepwise glucagon injections were assessed using a linear mixed-effects model with group-intervention interaction. Data are presented as a coefficient with a confidence interval. Raw P-values and the adjusted P-values using Benjamini-Hochberg are shown.

Table A: Impact of hypoglycemic exposure using time below range level 1. Metabolomics data before and after the completion of the glucagon injections of the participants with type 1 diabetes were assessed using a linear mixed-effects model and TBR level 1 as a fixed factor. Data are presented as a coefficient with a confidence interval. Raw P-values and the adjusted P-values using Benjamini-Hochberg are shown. Only metabolites with raw P-values <0.05 are presented. The complete dataset is available from the corresponding author upon request.

Table D: Impact of hypoglycemic exposure using hypoglycemic events per week level 2. Metabolomics data before and after the completion of the glucagon injections of the participants with type 1 diabetes were assessed using a linear mixed-effects model and HEPW level 2 as a fixed factor. Data are presented as a coefficient with a confidence interval. Raw P-values and the adjusted P-values using Benjamini-Hochberg are shown. Only metabolites with raw P-values <0.05 are presented. The complete dataset is available from the corresponding author upon request.

Metabolites	Coefficient	95% Confidence interval		P	P _{BH}
		Lower	Upper		
Fumaric acid	-0.37	-0.60	-0.14	0.002	0.39
2-Ketoisocaproic acid	-0.27	-0.53	-0.014	0.04	0.88
